

KaSiHub Production Readiness

Executive status, remaining controls, and the path to accepting international USDT share purchases

Current verdict: Production infrastructure is live and structurally ready. Commercial activation remains deliberately paused pending first-admin access, payment-route approval, and a controlled end-to-end rehearsal.

Decision snapshot

11	100,000	\$25	0
isolated production databases	Phase 1 shares configured	price per paid share	live campaigns or payment routes

LIVE AND VERIFIED

Encore production is Ready. All 11 schemas match staging structure, while production began without staging users, orders, campaigns, or payment records.

CONFIGURED, NOT SELLING

Four membership plans and Phase 1 economics are installed. Phase 1 is paused and BOGO is configured.

BLOCKED BY CONTROL

No first production administrator exists.
No wallet route, campaign, invitation, or payment acceptance is active.

Executive meaning

The platform is no longer waiting for core engineering. It is waiting for controlled operational activation. The safest route is to establish accountable administration, load approved receiving details, rehearse the complete flow without funds, and only then open a limited invitation campaign.

What is complete

Workstream	Verified outcome
Production boundary	Dedicated Encore production environment and deployment branch; no staging database clone.
Infrastructure	11 PostgreSQL databases, private object storage, backend service, chain RPC configuration, and webhook signing secret.
Schema parity	Columns, defaults, constraints, and indexes fingerprinted equal between staging and production.
Reference configuration	Member/admin roles, four source-approved membership plans, and USDT/USD server quote default.
Share economics	Phase 1: 100,000 shares, USD 25 per paid share, BOGO enabled, status paused.
Core contract	Live international registration policy returned HTTP 200 and routes international applicants to KYC plus USDT.

What remains intentionally off

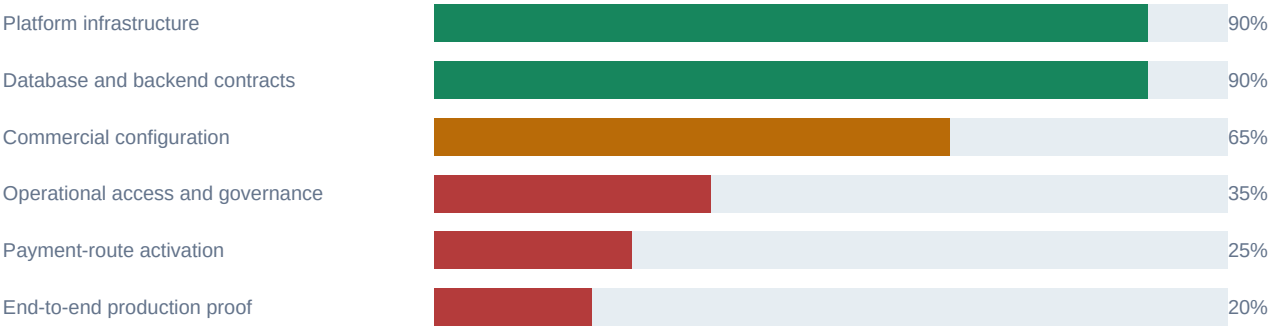

Production administrator	Zero production users and zero assigned admins. This prevents unaccountable campaign or configuration changes.
Receiving routes	No production Remitano/BSC/TRON receiving route has been activated.
Campaign and invitation	No production campaign or purchaser invitation exists.
Payment intake	No real payment instruction is exposed and no funds can be accepted through the presale flow.
Frontend cutover	Forge and Vercel have not been redirected to the new production Encore runtime.
Legal/operational approval	Final campaign terms, receiver confirmation, operator ownership, and go-live authorization still require named approval.

Controlled activation path

The remaining work is sequential. Skipping a gate creates financial or governance risk.

1	Establish authority	Create the first production administrator using an owner-controlled identity and temporary credential; verify login and role enforcement.
2	Approve payment route	Confirm exact USDT token contract, BSC/TRON receiver addresses, provider ownership, confirmation depth, and operator responsibilities.
3	Create draft campaign	Load the approved USD 25 Phase 1 campaign and invitation limits, leaving campaign and phase paused.
4	No-money rehearsal	Test signup, international routing, KYC gate, invitation, order quote, rejected proof, admin review, expiry, and incorporation controls.
5	Limited activation	Open a tightly capped invitation campaign, monitor orders and chain evidence, and retain immediate pause/rollback controls.
6	Frontend cutover	Point the selected public frontend to production Encore, then perform guarded browser and runtime verification.

Readiness assessment

Executive decisions required

Decision	Required action	Deadline
First production administrator	Name the accountable owner and provide the email identity. Use a temporary credential and rotate after first login.	Immediate
Approved receiving architecture	Confirm whether both BSC and TRON routes are enabled at launch, the exact USDT token contracts, and the two Remitano deposit addresses.	Before rehearsal
Campaign authority	Approve total allocation, BOGO terms, invitation caps, opening/closing dates, and who may pause or close the campaign.	Before draft finalization
Cutover surface	Choose Vercel, Forge, or both as the production frontend authority.	After rehearsal
Hosting maturity	Accept Encore Managed as interim hosting or authorize AWS/GCP production infrastructure.	Before material scale

Bottom line

We are one controlled activation cycle away from a limited real-money pilot.

The system should not be described as selling shares yet. It has the production infrastructure and core transaction controls, but it deliberately cannot accept a purchaser until accountable admin access, approved receiving routes, a draft campaign, and a successful no-money rehearsal are complete.

Evidence basis: Encore production rollout 20pe5oeagip95thu2a10; GitHub main ad0f814; live production registration-policy response; direct schema fingerprints and production row/configuration checks performed 12-13 August 2026.
